

One filter only from now on

Leucodepletion by ARCBS now means you no longer need to use a leucodepletion filter at the bedside.

You will still need to use a standard blood administration set with a 170 - 200 micron filter to remove clots and aggregates accumulated during storage.

Leucodepletion of all red cells and platelets is now fully implemented.

100% of red cells & platelets leucodepleted by ARCBS
